

Supplemental Figure S1. Prevalence ratio for blood pressure control associated with percentage West African ancestry modeled using a restricted cubic spline.

The solid black line represents the prevalence ratio and the grey shaded area represents the 95% confidence interval. The histogram represents the distribution of West African ancestry in the JHS population. The prevalence ratio is adjusted for age, sex, duration of hypertension, physical activity, smoking status, BMI, diabetes status, statin medication use, ACE/ARB use, beta-blocker use, calcium channel blocker use, diuretic use, and other antihypertensive medication use (i.e., i.e., alpha blockers, renin inhibitors, or aldosterone receptor antagonists, centrally acting agents, and direct acting vasodilators), C-reactive protein ≥ 3 mg/L, serum aldosterone levels, estimated glomerular filtration rate, history of myocardial infarction, and history of stroke)
